

**7.1.3 Describe the facilities in the Institution for the management of the following types of degradable and non-degradable waste**

The institutions should establish comprehensive waste management systems that include the following facilities:

- Segregation Stations: Clearly marked bins for degradable (organic) and non-degradable (plastic, metal, glass) waste to encourage proper disposal at the source.
- Composting Units: Facilities for the composting of organic waste, transforming it into nutrient-rich compost for landscaping and gardening. Biodegradable waste consisting of organic waste like leaves, trimmed-grass, small branches of plants, and the like are collected and segregated at source, and then waste processing is done. Compost generated from the first cycle is also being utilized as green manure.
- Awareness and Training Rooms: Workshops and training sessions are conducted on waste management practices, fostering a culture of sustainability among students and staff.
